

# How Relevant are the Theories of Gramsci to the Study of African States?

**Daniel Kendie, Ph.D.**

Associate Professor of History

Africa is vast, varied and complex. Moreover, it is the least developed of the developing regions. If class relations in many African countries are not determined by the control of the means of production, but by the relation of power, how useful and relevant are the ideas of Gramsci to the study of Africa?

The Italian social theorist, Antonio Gramsci, is now being recognized as the greatest Marxist thinker since Karl Marx. Whereas Marx produced volumes, Gramsci did not publish a single book. In the 1930s, when he was languishing in prison, he put down his ideas in a rather elliptical and allusive style. Such ideas were compiled and published under the title, *Prison Notebooks*. Nevertheless, his views are gaining considerable sympathy among social theorists and historians. His recognition of the revolutionary potential of the peasantry, for instance, has influenced the center-periphery-dependence debates that have characterized much of the writings of Gunder Frank, Wallerstein, Emmanuel, Samir Amin, and others. His theory of hegemony and domination has also been widely recognized as a necessary complement to Marxism.

This paper will therefore review the existing literature where his ideas have been used as tools of social inquiry, and then will investigate if pre-industrial African societies do fit his paradigm. As we will shortly see, the literature on Africa is very thin. Three dominant themes prevail. First, there are those like Robert Fatton who confine themselves to studying hegemony and domination in the context of post-colonial Africa. Second, there are those historians like Ronald Robinson who have devised a theory, in this case collaboration, to investigate the dimensions of hegemony and domination, but who limit themselves to the colonial era. Third, there are those historians like David Laitin and David Robinson who insist that both periods be studied in an integrated form as a coherent whole. As is to be expected, the debate between the approaches appears in the form of shadow boxing, but it does have every potential to be fully blown up. In writing this paper, I have the following objectives: first, to investigate the relevance of the operative assumptions of Marx/Gramsci to Africa, and then to suggest some reflections that there be an attempt to devise and articulate a more appropriate theory and methodology. Second, to propose that both historical periods be considered in an integrated form, in the interest of studying long-term social change.

## Understanding Gramsci's Theory of Domination and Hegemony

In common parlance, the word “domination” denotes subjugation, or the exercise of absolute control either by a state or by an individual. On the other hand, “hegemony” conveys such notions as influence, patronage or leadership. The Italian social theorist, Antonio Gramsci (1891-1937),<sup>[1]</sup> uses the two terms to analyze the structure of power of the European bourgeois

state of his time. For him, the cohesion of such a state springs from the spiritual and cultural supremacy it exercises through the manipulation of “civil society.”<sup>[ii]</sup> By using socializing mechanisms such as the church, schools, the press and other non-governmental institutions, the bourgeois state foists its own values and beliefs on society, thereby providing cultural direction. Its hegemony in this sense becomes rule by consent. It parallels the supremacy of force, but diminishes the need for its application. In contrast, domination is supremacy established by force and maintained by the state through military, political, judicial and fiscal systems. In this case, domination is the antithesis of hegemony. The hegemony of the state rests in part on ultimate coercive power, but the currency of force is devalued if it must be constantly applied. A state seeks rule by consent, and to secure habitual acquiescence to its authority. This makes legitimacy a requisite for the state.<sup>[iii]</sup>

Since Gramsci uses the two concepts in the context of revolutionary Marxism, it may be necessary to make a slight digression here and to provide some link between Gramsci and Marx. Marx expounded his ideas of revolution primarily for the industrially advanced countries of the time—namely, Britain, France and Germany. In fact, one could even say that his theory of a proletarian revolution has relevance only to modernizing capitalism, which sweeps away the pre-capitalist modes of production, and makes the proletariat the dominant class in society. The peasantry, which he contemptuously dismissed as “rural idiocy,” does not even come into the revolutionary ethos.

For the purpose of this paper, therefore, it is important to consider, even if briefly, what Marx calls the “base” and the “superstructure.” It would also be useful to note that while Marx had clear and strong ideas about “domination,” he had little to say regarding “hegemony.” The latter has been conceived, articulated and developed as a theory by Antonio Gramsci.

According to Marx, the “base” of the social order consists of the relations between men or between classes, which determines their various powers of control over the means of production, distribution, and exchange. It determines the actual place people occupy in society. Those who control the base constitute a ruling class and therefore exercise domination over society.<sup>[iv]</sup> On the other hand, the “superstructure” that rests upon the base encompasses all socializing mechanisms such as language, religion, education, law, ideology, mass media, trade unions, the army and the security apparatus. These mechanisms express, enforce and consolidate

the relations of economic power pertaining to the base.<sup>[v]</sup> Marx contends that various legal, political and cultural institutions are established in order to spread the values, beliefs and vested interests of the ruling class and hence maintain the status quo. For him, fundamental revolutionary change occurs in society only with the change in the base, i.e., with the transfer of ownership of the means of production. Administrative, legal and political changes that take place in the superstructure are superficial. They do not address the fundamental question of state power. Revolution, he said, would be possible only when the productive forces—i.e., the workers—develop to the level at which existing productive relations can no longer contain them or impede their further growth, and concludes that in the ensuing crisis, all oppressive institutions crumble and human liberation made possible.

Gramsci's views on domination are not at variance with those of Karl Marx. Where he

disagrees with him, and where Marx seems to have failed, is to see the role of hegemony in all this. Gramsci does not subscribe to the notion of human liberation as merely an inevitable consequence of the internal dynamics of capitalism. Unlike Marx, he saw the complex and concealed modes of class domination, which manifests itself in what he calls hegemony. By using his theory of hegemony, Gramsci therefore attempts to explain why the base will not simply crumble, and even if it does, revolution will not simply occur. Indeed, despite the fact that millions of industrial workers became unemployed in the industrially advanced countries of the West during the Great Depression of the early 1930s, popular front uprisings notwithstanding, there were no revolutions of the type that Marx had envisaged. If anything, Hitler and Mussolini came to power. In this respect, Gramsci argues that the power of the ruling class is not just limited to the economic base. It also manifests itself in the hegemony exercised from the superstructure, i.e., from the spiritual, ideological and cultural spheres that provide myth, consolidation and legitimacy to a given regime. He contends that the values, beliefs, consumption patterns and habits of thought of the ruling class do penetrate the proletariat. They rub-off on the population, distort their vision and negatively affect their perception. As a result, he argues that the task of human liberation cannot simply be considered inevitable, just because there is a crisis in the system. The population can easily be manipulated. The lack of critical consciousness cannot be lightly viewed. Under such circumstances, people can hardly be expected to question their conditions and still less to reject the values of the ruling class. And no matter how abject their living conditions, they will not think of revolution. If fundamental change is therefore to take place in society, Gramsci maintains that revolutionary seeds would have to be planted in a cultural soil that is prepared to accept them. The hegemony of the ruling class, i.e., the spiritual and cultural supremacy that it exercises by manipulating civil society, would have to be countered.

To that end, he argues that more attention should be given to revolutionary organization in the realm of culture and education. Factory discussion councils should be established to enhance the consciousness<sup>[vi]</sup> of the workers to help promote their solidarity, to restrict the decision-making capacity of the owners and eventually to take over the administrative functions of the factories. In his own words, “men, when they come to feel their strength and to be conscious of their responsibility and their value, will no longer suffer another man to impose his will on them and claim the right to control their actions and thoughts.”<sup>[vii]</sup>

In this respect, Gramsci's sociology of knowledge becomes a form of critical consciousness. Its validity resides in its ideological function of intellectually organizing the experiences of the masses. Thus, ideologies cease to be viewed as intellectual processes mystifying social reality as in Marx, and acquire true historical, psychological and sociological value.<sup>[viii]</sup> Marx was a revolutionary strategist. Nevertheless, and in such countries as China and Vietnam, viewed in retrospect, his prophecy of a proletarian revolution in the advanced capitalist countries of Western Europe, and still less, in Italy, has not been fulfilled. Indeed, in Gramsci's Italy of the 1920s for instance, despite rampant inflation, mass unemployment and industrial unrest, “history's chosen class—the proletariat,” did not promote the revolutionary upsurge. If anything, it came to terms with fascism. In this regard, it should be noted that the general pattern of peasant resistance to hegemonic thought and institutions, and the fact that it is the peasantry, rather than the proletariat, that has provided the major social base for successful

revolutions in the 20th century, has become a major paradox of Marxist theory.

Unlike Marx, Gramsci did recognize the revolutionary potential of the peasantry. But insofar as the passivity of the proletariat goes, he contends that this was made possible because the fundamental question of hegemony was not properly addressed. He therefore challenges Marxists to end their obsession with the economic base and to pay more attention to the superstructure and to promote intellectual debates to enhance consciousness. Who is to determine that the workers have an interest in revolution that goes beyond better wages and improved working conditions, Gramsci does not postulate. Nevertheless, he claims that in backward societies where the level of consciousness is low and where people are ruled by coercion, fear and apathy, a voluntaristic coup d'etat may be appropriate. But in the culturally advanced West where the workers willingly consent to existing arrangements, revolution presupposes a transformation of mass consciousness which can be effected through a protracted battle of "war of positions,"<sup>[ix]</sup> in which intellectuals play a significant role. Here, too, we should note that there is no compelling evidence to prove that the consciousness of the lower strata of society is low, or that the consciousness of the intellectuals is in the interest of the lower strata. In any case, Gramsci maintains that revolution is about people. Its primary objective is to change society for the better. For him, change is the result of the stimulus evoked by the friction of one group of ideas upon another. Thus, when members of the same group maintain different ideas with regard to the same subject in opposition, they necessarily evoke debate and discussion, thus enhancing consciousness. It is in this light that one should study Gramsci's theory of domination, hegemony, consciousness and revolution.

## Source Review

Anthropologists, economic historians and social theorists have produced a considerable body of literature that is based on Gramsci's ideas. Yet, and as we will shortly see, the literature concerning Africa is very thin. So too is the dimension of the debate regarding the use of his paradigms as tools for studying African society. In fact, one could even say that it has barely begun. Joseph Femia<sup>[x]</sup> examines Gramsci's political theory and the role of consciousness within the framework of historical materialism and its relationship to orthodox Marxism with specific reference to Italy (1914-1937). The study includes Gramsci's political conception of hegemony as an explanation of bourgeois dominance in the social order. Thomas Bates<sup>[xi]</sup> reviews Gramsci's theory of hegemony and explains its implications for the strategy of revolution. Leonardo Salamini<sup>[xii]</sup> analyzes Gramsci's theory of the primacy of superstructural over infrastructural activities, of ideological over political hegemony, and the subjective over the objective dimensions in Marxist theory of society. James Scott<sup>[xiii]</sup> relates Gramsci's theories to the general pattern of peasant resistance to hegemony and domination and explains why the peasantry rather than the proletariat has provided the major social base for successful revolutions in the 20th century. Walter Adamson<sup>[xiv]</sup> provides a study of Gramsci's political and cultural theory and looks at the historical period 1919-1935. In the process, he criticizes Gramsci for not being able to see anything between consent and coercion. Richard Sklar<sup>[xv]</sup> discusses aspects of class formation, consolidation, identification and action in Africa since independence. He tests the validity of a Marxist conception of class based solely on the domination of the means of production, and the idea of the subordination of African ruling classes to foreign capitalist interests. He concludes that class relations in Africa are determined by relations of power not

production, and that their formation, identification and action are determined by a coming together of holders of different functions including high-status occupation, high income, superior education and a specific measure of power, notably the ability to control the means of consumption and compulsion.

Adu Boahen[xvi] reviews the history of Africa (1880-1935) and discusses Africa's fate under colonial domination. Pearl-Alice Marsh[xvii] investigates how, facing massive African labor unrest, Pieter Botha retreated to state violence to assure foreign and domestic capital, that he had the solutions to industrial problems, and that his solutions were not contradictory to the basic goals of apartheid.

Bruce Berman,[xviii] examining the colonial state in Africa, investigates the different methods utilized by the French and the British, and how the colonial state was used as an agency of political domination in which the indigenous social forces were used as a means of establishing hegemony and domination. Donald Cruise O'Brien[xix] looks at how a dominant French culture and modes of political and economic organization were forcefully imposed upon an agglomerate of subordinated societies contained within arbitrarily drawn boundaries called Senegal. On the other hand, Roland Robinson[xx] sketches a theory of collaboration to explain the success of European powers in extending informal and formal control over much of Asia and Africa, how the agents of foreign domination bargained effectively, modified the impact of European rule and ushered in the process of decolonization. In his opinion, any new theory in this respect must find room for analysis of the most important mechanism of European management of the non-European world: the use of local collaborating groups—whether these be ruling elites, or landlords, or merchants, as mediators between Europe and the indigenous political and economic system. Gabriel R. Warburg[xxi] studies British rule in the Nile Valley 1882-1956. He tests Robinson's theory of collaboration and concludes that although the theory suffers from certain inaccuracies and generalizations, nevertheless, he says, one can state with certainty that the Sudan could not have been ruled by the handful of British officials backed by a symbolic British military presence, without the voluntary collaboration of large segments of the Sudanese populace and its elite.

David Laitin[xxii] defines hegemony as political forging—whether through coercion or elite bargaining—and institutionalization of a pattern of group activity in a state, and the concurrent idealization of that scheme into a dominant symbolic framework that reigns as common sense. Having done that, he looks at social systems theory which postulates that a change in a given sub-system within a social system responds to changes in other systems, which results in equilibrium or congruence. He relates both theories to Yorubaland in the late 19th and early 20th centuries, and how British imperial control and political cleavage were established there. Despite the fact that both Islam and Christianity co-existed in Yorubaland, the British chose ancestral city worship (politics) which functioned as a dominant symbolic framework as a means of establishing hegemony through coercion, elite bargaining or cooptation. Having concluded that mutual adjustment of values among sub-systems unlikely, he maintains that one must prevail and become hegemonic, setting standards for emulation. He challenges social theorists like Clifford Geertz to re-think their theory of primordialism and the notion that Africa is afflicted with primordial conflicts, which, in the case of Yorubaland, he thinks cannot be theoretically sustained. In a lucid and comprehensive article, David Laitin[xxiii] also studies the

rise and fall of the Yoruba state of the same period. The rise of British hegemony should have meant a decline in freedom of trade for the Africans. But in contrast to what widely held theories would predict, he says that the Yoruba state was strengthened through greater exposure to international commerce. Its traders were able to penetrate international markets even during periods of economic crisis with considerable success. In light of these findings, he suggests that some conventional theories be reformulated.

For Robert Fatton,[\[xxiv\]](#) hegemony requires the “expansion” of the state whereby potential allies and even antagonistic elements are gradually absorbed into the institutions of the state. Having studied Senegalese political history (1975-1985), he concludes: “facing a systematic crisis, the Senegalese ruling class has sought to establish its hegemony through a passive revolution (revolution from above)—rooted in democratization rather than repression.”

In this case, he meant the legalization of three political parties representing the right, the left and the center. In the same way, Robert Fatton[\[xxv\]](#) also studies present-day South Africa. He defines ideologies as symbolically changed beliefs and expressions that present, interpret and evaluate the world in a way that is designed to shape, mobilize, direct and justify certain courses of action. Having examined how Black Consciousness emerged in South Africa as an ideological resistance to white supremacy, he concludes that because the apartheid regime had discovered that domination had exorbitant costs militarily, politically and economically, it had to seek other means of ruling through hegemony, for example, Bantustanization. Finally, David Robinson[\[xxvi\]](#) takes up the debate to which Africanists have given attention only recently, i.e., the extension of hegemony, which accompanied European domination. For him, whatever French hegemony or domination exists—for instance, in present day Senegal—has to be traced back to the period 1850-1920. He invites others to do likewise with similar situations. In this, he pays tribute to the scholarship of David Laitin. Robinson argues that any attempt to study the relevance of Gramsci's theories merely to post colonial Africa is unrealistic. There must also be a corresponding effort to the study of the colonial era.

## **Gramsci's Relevance to Africa**

The question raised by David Robinson is, certainly, very pertinent. As we go along, we will still raise more questions, not because we have answers to them, but in the belief that they could stimulate more discussion and encourage more research. Before we attempt to consider Gramsci's relevance or irrelevance to Africa, let us therefore begin with a brief survey of Africa's conditions.

Africa remains, by any standard, the least developed of the developing regions. It has twenty-one of the thirty-six least developed countries of the world. It has the lowest Gross Domestic Product, the lowest net capital formation, the fewest doctors and the highest rates of illiteracy. The greater number of African countries are unable to feed their populations. Where surplus of any commodity is to be found, it is a formidable problem to get the commodities where they are needed because the transport linkages are weak. Unemployment in urban areas has also reached unacceptable levels.[\[xxvii\]](#)

Marx's theory of the base and the superstructure can be utilized to the study of any

African (class?) society. But how useful and relevant is his theory of a proletarian revolution to Africa, in view of what was just said? The more so, if, as Richard Sklar argues, class relations in Africa are not determined by the control of the means of production, but by relations of power. Gramsci like Marx was not concerned with the application of his theories to non-European and colonial situations. Apart from the difficulty of unravelling the meaning of his ideas from the Prison Notebooks and drawing a consistent theory from them, his interest in the peasantry has prompted no detailed study devoted exclusively to it. Yet, his views about the revolutionary potential of the peasantry have gained considerable sympathy among social theorists and historians. In that case, shall we study Gramsci without Marx? But then, what is Gramsci without Marx?

To make matters worse, Africa is so vast, different and complex that it does not lend itself into any simple categorization. The conventional view is that, throughout the continent, cultural sub-systems are diverse, that language, religion, kinship and occupation are categories that divide different sub-sets of a single society, that only a handful of established African states are culturally homogeneous, that in many cases the cleavages of cultural pluralism are more apparent than class divisions, and that ethnic or religious identifications have the capacity to generate intense emotional commitments. [\[xxviii\]](#) In light of the findings of David Laitin in Yorubaland, and the challenge he has issued to primordial theorists like Geertz to rethink and to reformulate their theories, how shall we reconcile the conventional view with that of Laitin? Even if we were conventionalists, at what level could we study the application of Gramsci's theory of hegemony and domination—at the clan, tribal or national level? What is the relevance of what Gramsci calls the ideological subordination of the working class by the bourgeoisie in the African context? With the exception of a few established states like Egypt, South Africa, Nigeria and others, the emergence of the bourgeoisie in the rest is a recent phenomena. In fact, the role played by the European bourgeoisie of the 19th century in the area of capital accumulation and industrialization is being performed in much of Africa today, by the state. However, in conditions where dualism and uneven development prevail, and where cultural and economic integration do not exist vertically and horizontally, how much domination and hegemony is exercised by the state? How much influence do foreign powers, businessmen and missionaries exercise in today's Africa? To what extent could one ignore the colonial era and its legacy and try to study the hegemony and domination of the contemporary African state, as Robert Fatton has attempted to do with regard to Senegal? It is misleading to attempt a single analytical explanation, or to use stereotyped models that have no theoretical insight. A critical study of Senegal's history would have enabled us to understand its past and to offer a better vantage point from which to view the present. His study of South Africa is equally misleading. South Africa is a more structured and established state than Senegal, where Gramsci's theory of domination and hegemony could be more appropriate. His book traces the history of Black resistance to white domination and tries to explain how *Black Consciousness* evolved as a direct response to white domination. Such consciousness, as may exist, we are told, dismisses the peasantry as reactionary, the petite bourgeoisie as co-opted collaborators, white liberals as patronizing, and foreign investment as a plague. The study has also other serious flaws. Several examples will serve to illustrate the point. First, it emphasizes form at the expense of content. The stress is on the superstructure. There is very little consideration of the base. One would learn precious little about agriculture, industry, manufacturing and services to realize how black Africans were being dominated and exploited. Supposing there was a change at the level of the

superstructure, would that also lead to a corresponding change at the base? He argues that foreign investment contributed to the maintenance of the system, but does not tell us how its termination or removal would have necessarily reversed the situation. Moreover, he claims that because the regime had discovered that domination had exorbitant costs, economically and militarily, it resorted to forging new means of hegemony such as Bantustanization and the employing of 12,000 blacks in the army. However, the defense costs he provides do not prove his point. He says that military spending had increased from R 472 million to R 2 billion (1977). The book was published in 1986. The figures provided are for 1977. There is an information gap. Under such circumstances, one cannot determine if hegemony or domination was on the ascendance. The regime was dominant because it wanted to resolve all problems and disputes with the iron fist. But it was also weak because its very survival depended on crude repression.

Within the available space that time permits, an attempt was made to review the limited literature that exists, and that has preoccupied historians and social theorists who operate within the framework of Gramsci's paradigm. As we have also seen, there are differences in approach and in interpretation. The debate has just started in the form of what one may call shadow boxing, but it does have the potential to become fully blown. As far as Africa is concerned, one cannot claim for the formulations an unassailable universality and self-sufficiency. As indicated in the review, it is only David Laitin who has given sufficient attention to the establishment of hegemony and domination in the colonial era and linked their extension to the post colonial situation. Others like Robert Fatton (Senegal and South Africa) have closed their eyes to the past. Such an approach makes the analysis inadequate and superficial. At the very least, and at a general theoretical level, the cultural, political, ideological and economic dimensions of hegemony and domination should provide the following:

- a. Consideration of how the theories might be applied to specific African conditions, or whether they require a significant modification.
- b. A critical understanding and analysis of the situation before and during the colonial era.
  1. A correct appraisal of the extension of hegemony and domination to the post colonial period.

Basic to the use of Gramsci's theories as tools for studying African states is the concept of sovereignty. Its validity rests on the premise that the state is independent of the dictation of any other authority. The notion that full independence exists in an interdependent world is a political and historical fiction. However, since hegemony and domination contravene the premise of autonomy, this serviceable fiction would have to be maintained. Hence, our starting point will have to be the colonial era. It was an era in which external hegemony and domination was deepened. The corpus of state theory itself was derived from Europe and was diffused to Africa through imperial imposition. Even the notion of the nation-state was mediated through the intrusive erection of the colonial state. Its bureaucratic apparatus—parties, parliaments, presidents, ministers, etc., the upholding of hegemony by the state over the territory it rules, the exercise of coercion considered legitimate, judicial concepts of state organization—of course stripped of their representational and constitutional aspects—all were derived from the European

model.

Moreover, given the racist slur that African cultures were without redeeming values, it was also felt that the uplifting of the African from his “barbarism” and “savagery” could be effected only through acceptance of European culture. As a result, all socializing mechanisms, including language, religion, education, ideology, law, mass media, trade unions, and so on, became European in form, if not in content. Even the modern instrument of repression and domination—the army and security apparatus—were introduced by the colonial power. If this takes care of the superstructure, let us also look at the base. During the colonial era, previously isolated communities were drawn into the world economy. The commercialization of peasant agriculture, the imposition of the plantation economy, the establishment of the service industry, mining, some manufacturing, and the financing of trade by the creation of a single multilateral system of international payments, with all the consequences of uneven development and dependence, took root during the colonial era—a historical fact from which Africa still suffers and which has only resulted in creating a pattern of dependence.

Even when decolonization came, it was more of a negotiated settlement than anything else. The African states began to hoist national flags, sing national anthems and vote at the United Nations. Even the bureaucracy was Africanized, but beyond that, little has changed. The African states are theoretically independent, but in reality they are economically and financially dependent, so that European hegemony and domination still prevail. To argue that Gramsci's theory of hegemony and domination is applicable to Africa is but to state the obvious. To confine oneself to the post colonial era, and to close one's eyes to the historical period in which European powers established their domination and hegemony, whose consequences are still being deeply felt, as some Africanists have attempted to do, is to be wholly mechanical and unscientific.

## **Conclusion**

The first problem for Africanists is to respond to the challenges issued by David Laitin, who argues that conventional theories about Africa be reformulated. Once this is properly addressed, the task of an initial critique of the relevance of Gramsci's theory to Africa should focus on what is at fault with the theory itself. In this case, Africanists must seriously consider Adamson's pertinent observation regarding what he calls Gramsci's failure to see anything between coercion and consent. This may require a fundamental restructuring of the theory itself.

It may be difficult to separate Gramsci from Marx. But it should also be recognized that many of Marx's assumptions are in many ways irrelevant to Africa—the more so, if, as Richard Sklar argues, class relations in Africa are determined not by the ownership of the means of production, but by the ability to control the means of compulsion. The eagerness to employ the precepts of a theory without awareness of its implications can therefore only be dangerous. Furthermore, since Gramsci feels that in backward societies where the level of consciousness is low and where people are ruled by apathy and fear, a coup d'etat of the Russian type may be appropriate. Since the gun determines class domination, some African regimes that call themselves revolutionaries and Marxists, but who are an anti-thesis to everything he espoused, have been installed. Would Gramsci approve of them? That the hegemony and domination

which existed during the colonial era has been extended to the present day cannot be disputed. However, there is the need to integrate both phases and to examine the validity of Robinson's theory of collaboration. Failing that, the models employed cannot be considered as conceptual responses to empirically established research, but as forcing African conditions to fit the models. It seems, indeed, that a more analytical investigation remains to be done.

## Bibliography and Endnotes

---

[i] Since at least the 1970's, he is being considered as one of the most important Marxist theorists since Marx. His ideas were written in Italian prisons in elliptical and allusive style so as to escape the censors. Thereafter, they were compiled and published under the title, *Prison Notebooks*.

[ii] In this context, Gramsci meant the mechanisms of socialization such as the church, mass media and the trade unions.

## **Biographical Sketch**

Daniel Kendie graduated (M.SC. honours, Economics), from the University of Prague, and then from the International Institute of Social Studies, The Hague, Netherlands, (M.A. Social and Political Science). Subsequently, he was awarded a three-year Fellowship by the United Nations Institute for Training and Research, in New York, where he completed a major study on the problem of peace and development in Africa. Having been granted a scholarship and a fellowship by Michigan State University, he completed his Ph.D. there, specializing on the modern history of the Middle East, Africa and Russia - the Soviet Union.
